

ABSTRACT

A windshield wiper blade sharpener device includes a block having a groove for receiving a wiper blade, and an abrasive coated surface disposed in the groove of the block for engaging with and
5 for sharpening the wiper blade. The block includes one or more passages and one or more orifices communicating with the groove of the block. A casing may be attached to the block and has a chamber to receive a fluid which may be supplied to the groove of the block via the orifice of the block. A cover may be attached to the
10 block, and has one or more studs to engage onto and to block and to shield the orifice of the block.
